CYSTIC FIBROSIS Australia

SURVEY

Project Title: Reproductive and sexual health care survey of Australian adults living with cystic fibrosis to help co-design service provisions

1. Who should take part in this clinical study?
We would like to invite you to take part in our clinical study. This is because you have cystic fibrosis and are >18 years of age.

2. Why are we doing this research?
In this survey we are trying to find out more about the reproductive and sexual healthcare needs of adult women and men living with cystic fibrosis (CF) so we can help integrate this into routine and wholistic clinical care. With the introduction of modulator therapies, adults with CF are anticipated to have increased life expectancy. There is increased incidence of pregnancies and transition to menopause in women. And in men, fertility and sexual function are also important.
We believe addressing reproductive and sexual healthcare needs of adult women and men living with CF is an important part of the clinical care that needs to be provided by the CF multidisciplinary team.

3. What is involved in the study?
Answering the survey questions to the best of your ability. All questions are in English language.

4. Who is conducting and paying for this research?
Dr Shanal Kumar is an adult endocrinologist (hormone specialist) at the Prince Charles Hospital CF service and is leading this research. There is no funding for this research currently. There is no cost to you (other than your time) to participate in this survey. You will not be renumerated to complete this survey.

5. What will happen to the confidential information about me?
We will keep all survey information confidential and securely stored. No personal information about you, such as your name and address will be collected.
